

# Appendix F ASCII Character Set

---

ASCII is an acronym for *American Standard Code for Information Interchange*. ASCII is a code in which the numbers from 0–127 stand for text characters, including letters of the alphabet, the digits 0–9, punctuation marks, special characters, and control characters. ASCII is used for representing text inside of the computer and for transmitting text between computers. The Text and XMODEM protocols transfer files that consist only of ASCII characters; such files are also known as Text files.

When submitting data to the WHPO in the —.SUM, —.SEA, —.LVS, or —.CTD files only ASCII characters shown below should be included as these files are designed to be read by FORTRAN programs. The restriction *does not apply* to the —.DOC file, which can be submitted in any word processing program tabulated in Appendix E.

If submitting text files in ASCII please observe the following conventions to facilitate formatting by the WHPO for printing:

- Do not use a hyphen (-) to separate parts of a compound word.
- Please use a decimal (.) to delineate fractional values rather than a comma (,) and include the leading zero on small numbers, i.e., 0.045 rather than .045 or 0,045.
- Tables should be tab or comma delimited with no spaces between entries and each row delimited by a carriage return/line feed (CR/LF).
- Experience has shown that tables submitted in ASCII format are particularly susceptible to formatting errors. It is suggested that proof copies of all formatted tables submitted originally in ASCII format be carefully checked.
- Put a CR/LF only between paragraphs in text if possible or, alternatively, include one blank line between paragraphs.
