

List of Figures

FIGURE 2.1:	Large volume sample drawing sequence.	16
FIGURE C.1:	The A11 cruise track defined by CTD/rosette stations..	95
FIGURE C.2:	Location of 10 liter water samples collected on A11.	97
FIGURE C.3:	Silicate concentration vs. potential temperature for A11 (*) and SAVE 4 data: both are in the Argentine Basin and for the whole water column. The inset, for the deepest levels, shows the small discrepancy between the data sets.	98
FIGURE C.4:	Dissolved oxygen concentration vs. salinity for A11 (*) and SAVE 4 data: both are in the Argentine Basin and for the whole water column. The inset, where the deepest levels form the left branch of the Y, shows the small discrepancy between the data sets.	99
FIGURE C.5:	Surface salinity and temperature on cruise A11. The cruise begins on the Argentine Shelf, passes through the Falkland Current (day 363), the Brazil Current retroflection (day 365), traverses the Subantarctic Zone until somewhere between data 386 and 390 it enters the subtropical gyre. The cruise ends in South Africa..	106
FIGURE C.6:	Deep water collected on station 12240 from 2500 m was used as quality control for the nutrient measurements: results are shown for the last 50 stations of the cruise.	115
FIGURE C.7:	A comparison of CFC-11 and CFC-12 data from (a) SAVE station 291 and A11 station 12273 and (b) SAVE station 200 and A11 station 12295.	117
